

Future Plans at Jefferson Lab: 12 GeV Upgrade and ELIC

Allison Lung
Jefferson Lab

DIS 2007
Munich, Germany
April 19, 2007

OUTLINE

- 12 GeV Upgrade:
 - Jefferson Lab Today and Tomorrow
 - Highlights of Science Program
 - Project Status
- ELIC:
 - Jefferson Lab Science Beyond 12 GeV Upgrade
 - Design Approach
 - Next Steps

Jefferson Lab Today

2000 member international user community engaged in exploring quark-gluon structure of matter

Superconducting accelerator provides 100% duty factor beams of unprecedented quality, with energies up to 6 GeV

CEBAF's innovative design allows delivery of beam with unique properties to three experimental halls simultaneously

Each of the three halls offers complementary experimental capabilities and allows for large equipment installations to extend scientific reach

Jefferson Lab Today

Hall A

Two high-resolution
4 GeV spectrometers

Jefferson Lab
CLAS Detector

Hall B

Large acceptance spectrometer
electron/photon beams

Hall C

7 GeV spectrometer,
1.8 GeV spectrometer,
large installation experiments

C

12 GeV CEBAF

Architect's Rendering of Hall D Complex

Overview of Upgrade Technical Performance Requirements

Hall D	Hall B	Hall C	Hall A
excellent hermeticity	luminosity 10 x 10 ³⁴	energy reach	installation space
polarized photons	hermeticity	precision	
E _γ ~8.5–9 GeV	11 GeV beamline		
10 ⁸ photons/s	target flexibility		
good momentum/angle resolution		excellent momentum resolution	
high multiplicity reconstruction		luminosity up to 10 ³⁸	
particle ID			

12 GeV Capabilities

Hall D – exploring origin of **confinement** by studying **exotic mesons**

Hall B – understanding **nucleon structure** via **generalized parton distributions**

Hall C – precision determination of **valence quark properties** in nucleons and nuclei

Hall A – short range correlations, form factors, hyper-nuclear physics, future **new experiments**

Highlights of the 12 GeV Science Program

- Unlocking secrets of QCD: quark confinement
- New and revolutionary access to the structure of the proton and neutron
- Discovering the quark structure of nuclei
- High precision tests of the Standard Model

DIS 2007 Talks:

Antje Bruell

Zein-Eddine Meziani

Krishna Kumar

Gluonic Excitations and the Origin of Confinement

QCD predicts a rich spectrum of as yet to be discovered gluonic excitations - whose experimental verification is crucial for our understanding of QCD in the confinement regime.

With the upgraded CEBAF, a linearly polarized photon beam, and the GlueX detector, Jefferson Lab will be uniquely poised to:

- discover these states,
- map out their spectrum, and
- measure their properties

New, comprehensive view of hadronic structure

Elastic Scattering
transverse quark
distribution in
Coordinate space

DIS
longitudinal
quark distribution
in momentum space

GPDs
The fully-correlated
Quark distribution in
both coordinate and
momentum space

Quark Structure of Nuclei

- (Nucleons and Pions) or (Quarks and Gluons)?
- Not a simple convolution of free nucleon structure with Fermi motion
- In nuclear deep-inelastic scattering, we look directly at the quark structure of nuclei

12 GeV Upgrade Provides Substantially Enhanced Access to the DIS Regime

Measuring High-x Structure Functions

REQUIRES:

- High beam polarization
- High electron current
- High target polarization
- Large solid angle spectrometers

12 GeV will access the regime ($x > 0.3$), where
valence quarks dominate

Figure 1 consists of six panels, (a) through (f), each showing the evolution of the electron distribution function $f(v)$ for different magnetic field strengths B . Each panel includes a table of parameters and a plot of $f(v)$ versus v .

- Panel (a):** $B = 0.1$. Parameters: $T_0 = 1.0$, $n_0 = 1.0$, $B_0 = 0.1$. The plot shows a broad distribution of $f(v)$ centered around $v = 0$.
- Panel (b):** $B = 0.2$. Parameters: $T_0 = 1.0$, $n_0 = 1.0$, $B_0 = 0.2$. The distribution is slightly more peaked than in (a).
- Panel (c):** $B = 0.3$. Parameters: $T_0 = 1.0$, $n_0 = 1.0$, $B_0 = 0.3$. The distribution is more peaked and shifted towards higher velocities.
- Panel (d):** $B = 0.4$. Parameters: $T_0 = 1.0$, $n_0 = 1.0$, $B_0 = 0.4$. The distribution is highly peaked and shifted towards higher velocities.
- Panel (e):** $B = 0.5$. Parameters: $T_0 = 1.0$, $n_0 = 1.0$, $B_0 = 0.5$. The distribution is very peaked and shifted towards higher velocities.
- Panel (f):** $B = 0.6$. Parameters: $T_0 = 1.0$, $n_0 = 1.0$, $B_0 = 0.6$. The distribution is extremely peaked and shifted towards higher velocities.

The plots show the distribution function $f(v)$ as a function of velocity v , with the distribution becoming more peaked and shifted to higher velocities as B increases.

Figure 1 consists of six panels, each showing the evolution of the number of active cases (N) over time (t) for a specific region. Each panel includes a table of data and a corresponding line graph. The regions are: (a) North America, (b) Europe, (c) Asia, (d) Africa, (e) Oceania, and (f) South America. The graphs show the number of active cases (N) on the y-axis and time (t) on the x-axis. The data is color-coded by region: North America (blue), Europe (orange), Asia (green), Africa (red), Oceania (purple), and South America (brown).

The 12 GeV Upgrade Project: Status and Schedule

[illegible]

DOE Generic Project Timeline

Figure 1-1. DOE Acquisition Management System.

12 GeV Upgrade: Phases and Schedule

(based on funding guidance provided by DOE-NP in March 2007)

- ❑ 2004-2005 Conceptual Design (CDR) - *finished*
- ❑ 2004-2008 Research and Development (R&D) - *ongoing*
- ❑ 2006 Advanced Conceptual Design (ACD) - *finished*
- ❑ 2006-2008 Project Engineering & Design (PED) - *ongoing*
- ❑ 2009-2013 Construction – *starts in ~18 months!*
 - ❑ *Accelerator shutdown start mid 2012*
 - ❑ *Accelerator commissioning mid 2013*
- ❑ 2013-2015 Pre-Ops (beam commissioning)
 - ❑ *Hall commissioning start late 2013*

CD-2 September '07

- December & January: DOE Project Status Review
 - “The 12 GeV Upgrade Project is on track in their preparations and readiness for the SC IPR, OECM EIR and September 2007 CD-2 approval.”
- June 26-28: Critical Decision 2 Review, stage I
 - SC Independent Project Review (IPR): conducted by Dan Lehman (DOE SC Office of Project Assessment)
- Aug 6-10 (tentative): Critical Decision 2 Review, stage II
 - External Independent Review (EIR): conducted by DOE Office of Engineering Construction Management (OECM)
- Aug 6-10: JLab PAC32
 - Second review of 12 GeV proposals – “commissioning experiments”
 - Key step in identifying the research interests and contributions of international collaborators

12 GeV Upgrade Summary

- Essential to address key questions in hadronic physics
 - Broad and diverse scientific program
 - Unique and complementary kinematic reach and capabilities
 - Strong opportunity for international collaboration
- 12 GeV Project: Construction start in ~18 months
 - Critical Decision 2 in September 2007 (baseline)
 - Critical Decision 3 in September 2008 (construction start)
 - We are on track for accomplishing this!

ELIC: Science Motivation

A High Luminosity, High Energy Electron-Ion Collider:

A New Experimental Quest to Study the Glue which Binds Us All

How do we understand the visible matter in our universe in terms of the fundamental quarks and gluons of QCD?

Explore the new QCD frontier: strong color fields in nuclei:

- How do the gluons contribute to the structure of the nucleus?
- What are the properties of high density gluon matter?
- How do fast quarks or gluons interact as they traverse nuclear matter?

Precisely image the sea-quarks and gluons in the nucleon:

- How do the gluons and sea-quarks contribute to the spin structure of the nucleon?
- What is the spatial distribution of the gluons and sea quarks in the nucleon?
- How do hadronic final-states form in QCD?

DIS2007 Talks:
Antje Bruell
Bernd Surrow

The Spin Structure of the Nucleon

Proton helicity sum rule:

$$\frac{1}{2} = \frac{1}{2} \Delta\Sigma + \Delta G + L_q + L_g$$

We know from lepton scattering experiments over the last three decades that:

- quark contribution $\Delta\Sigma \approx 0.3$
- gluon contribution $\Delta G \approx 1 \pm 1$
- valence quark polarizations as expected
- measured anti-quark polarizations are consistent with zero

ΔG : a "quotable" property of the proton
(like mass, momentum contrib., ...)

(However, Q^2 dependent: $\Delta G(Q^2) \propto \frac{1}{\alpha_s(Q^2)}$)

World Data on F_2^p

An EIC makes it possible!

ELIC Study Group & Collaborators

A. Afanasev, A. Bogacz, P. Brindza, A. Bruell, L. Cardman, Y. Chao, S. Chattopadhyay, E. Chudakov, P. Degtiarenko, J. Delayen, Ya. Derbenev, R. Ent, P. Evtushenko, A. Freyberger, D. Gaskell, J. Grames, A. Hutton, R. Kazimi, G. Krafft, R. Li, L. Merminga, J. Musson, M. Poelker, R. Rimmer, A. Thomas, H. Wang, C. Weiss, B. Wojtsekhowski, B. Yunn, Y. Zhang - Jefferson Laboratory

W. Fischer, C. Montag - Brookhaven National Laboratory

V. Danilov - Oak Ridge National Laboratory

V. Dudnikov - Brookhaven Technology Group

P. Ostroumov - Argonne National Laboratory

V. Derenchuk - Indiana University Cyclotron Facility

A. Belov - Institute of Nuclear Research, Moscow-Troitsk, Russia

V. Shemelin - Cornell University

ELIC Accelerator Design Goals

- Center-of-mass energy between 20 GeV and 90 GeV:
with energy asymmetry of ~ 10 , which yields
($E_e \sim 3$ GeV on $E_A \sim 30$ GeV) up to ($E_e \sim 9$ GeV on $E_A \sim 225$ GeV)
- Average Luminosity from 10^{33} to $10^{35} \text{ cm}^{-2} \text{ sec}^{-1}$ per Interaction Region
- Ion Species:
 - Polarized H, D, ^3He , possibly Li
 - Ions up to $A = 208$
- Polarization:
 - Longitudinal for both beams in the interaction region
 - Transverse polarization of ions
 - Spin-flip of both beams
 - All polarizations $>70\%$ desirable
- Positron Beam desirable

ELIC Layout

30-225 GeV protons
30-100 GeV/n ions

Green-field design of ion complex directly aimed at full exploitation of science program.

3-9 GeV electrons
3-9 GeV positrons

Design Features of ELIC

Directly aimed at optimizing the science program:

- Ring-Ring design where 12 GeV CEBAF accelerator serves as injector to electron ring.
- Unprecedented luminosity through short ion bunches, low β^* , and high rep rate (crab crossing).
- Four interaction regions for high productivity ($[\pm 3 \text{ m}]$ element-free region around the IP's).
- Polarized positron beam possible as well as e^-e^- colliding beams.
- Present JLab DC polarized electron gun meets beam current requirements for filling storage ring.
- Collider operation appears compatible with *simultaneous* 12 GeV CEBAF operation for fixed target program.

Accelerator R&D Required for ELIC

To achieve luminosity at $\sim 10^{33} \text{ cm}^{-2} \text{ sec}^{-1}$

- High energy electron cooling with circulator ring

To achieve luminosity at $\sim 10^{35} \text{ cm}^{-2} \text{ sec}^{-1}$

- Crab crossing
- Stability of intense ion beams
- Beam-beam interactions
- High RF frequency (part of detector R&D)

ELIC Summary

- A compelling scientific case is developing for an electron ion collider to address fundamental questions in hadronic physics.
 - Complements definitive study of valence region at JLab 12 GeV
- JLab design studies have led to:
 - Ring-Ring approach that uses CEBAF as a full energy e- injector and can be integrated with the 12 GeV fixed target program for physics
 - Includes heavy ions, $20 < E_{\text{CM}} < 90$ GeV
 - L_p at or above $10^{35} \text{ cm}^{-2}\text{s}^{-1}$ (per nucleon) possible
 - L_p up to $10^{33} \text{ cm}^{-2}\text{s}^{-1}$ can be achieved with state-of-the-art technology, except for electron cooling
- JLab is committed to collaborative approach for developing science case and optimal technical design for a next generation EIC.
- A pre-R&D plan to address EIC accelerator physics and technology issues has been developed, and hopefully will be included in the NSAC LRP.

Thomas Jefferson National Accelerator Facility

A. Lung, DIS2007 April 19, 2007

ELIC BACKUP TRANSPARENCIES

ELIC Recent Developments

ELIC design evolves

- in response to Science requirements (e.g. Rutgers mtg.)
- towards a more robust and reliable concept which relies increasingly on proven state-of-the-art technology.

Recent developments include:

- Higher center-of-mass energy and inclusion of heavy ions, up to Pb
- [Concept of SRF ion linac for all ions](#) (ANL design)
- The use of stochastic cooling to accumulate intense ion beam
- Reducing crab cavity voltage requirement by decreasing crossing angle from 100 mrad to 50 mrad and in combination with [a new Lambertson-type final focus quadrupole](#)
 - Longer [± 3 m] element-free region around the IP's

Advantages/Features of ELIC

- JLab DC polarized electron gun already meets beam current requirements for filling the storage ring.
- A conventional kicker already in use in many storage rings would be sufficient.
- The 12 GeV CEBAF accelerator can serve as an injector to the ring. RF power upgrade might be required later depending on the performance of ring.
- Physics experiments with polarized positron beam are possible.
- Possibilities for e^+e^- , e^-e^- , e^+e^+ colliding beams.
- No spin sensitivity to energy and optics.
- No orbit change with energy despite spin rotation.
- Collider operation appears compatible with *simultaneous* 12 GeV CEBAF operation for fixed target program.

World Data on F_2^p

World Data on g_1^p

→ 50% of momentum
carried by gluons

→ 20% of proton spin
carried by quark spin

The Quest for ΔG

First approach: use scaling violations of world g_1 spin structure function measurements

Not enough range in x and Q^2

$$\Delta G(1 \text{ GeV}^2) \approx 1.8$$

$$\Delta G(1 \text{ GeV}^2) \approx 0.4$$

$$\Delta G(1 \text{ GeV}^2) \approx -1.7$$

12 GeV BACK - UP

High-level Parameters

Beam energy	12 GeV
Beam power	1 MW
Beam current (Hall D)	5 μ A
Emittance @ 12 GeV	10 nm-rad
Energy spread @ 12 GeV	0.02%
Simultaneous beam delivery	Up to 3 halls

Kinematics for deeply exclusive experiments

GPDs via cross sections and asymmetries

EMC Effect - Theoretical Explanations

Quark picture

- Multi-quark cluster models
 - Nucleus contains multinucleon clusters (e.g., 6-quark bag)
- Dynamical rescaling
 - Confinement radius larger due to proximity to other nucleons

Hadron picture

- Nuclear binding
 - Effects due to Fermi motion and nuclear binding energy, including virtual pion exchange
- Short range correlations
 - High momentum components in nucleon wave function

Quark Structure of Nuclei:

Origin of the EMC Effect

- Observation that structure functions are altered in nuclei shocked much of the HEP community 23 years ago
- ~1000 papers on the topic; models explain the curve by change of nucleon structure, but more data are needed to uniquely identify the origin

What is it that alters the quark momentum in the nucleus?

J. Ashman *et al.*, Z. Phys. C57, 211 (1993)

J. Gomez *et al.*, Phys. Rev. D49, 4348 (1994)
